# Definition: Function

## Definition

Let  $A$  and  $B$  be non empty sets. A **function**  $f$  from  $A$  to  $B$  is an assignment of *exactly one* element of  $B$  to each element of  $A$ . We write  $f(a) = b$  if  $b$  is the *unique* element of  $B$  assigned by the function  $f$  to the element  $a$  of  $A$ . If  $f$  is a function from  $A$  to  $B$ , we write  $f : A \rightarrow B$ .

# Definitions: Domain, Codomain, Image, Preimage and Range

## Definition

If  $f$  is a function from  $A$  to  $B$ , we say that  $A$  is the **domain** of  $f$  and  $B$  is the **codomain** of  $f$ .

If  $f(a) = b$ , we say that  $b$  is the **image** of  $a$  and  $a$  is the **preimage** of  $b$ .

The **range** of  $f$  is the set of all images of elements of  $A$ .

Also, If  $f$  is a function from  $A$  to  $B$ , we say that  $f$  **maps**  $A$  to  $B$ .

# Definition: Image of a Subset

## Definition

Let  $f$  be a function from the set  $A$  to the set  $B$  and let  $S$  be a subset of  $A$ . The **image** of  $S$  under the function  $f$  is the subset of  $B$  that consists of the images of the elements of  $S$ . We denote the image of  $S$  by  $f(S)$ , so

$$f(S) = \{t \in B \mid \exists s \in S \text{ with } (t = f(s))\}.$$

We also use the shorthand  $f(S) = \{f(s) \mid s \in S\}$  to denote this set.

# Example

- The domain of  $f$  is  $A = \{a, b, c, d\}$ .
- The codomain of  $f$  is  $B = \{x, y, z\}$ .
- $f(a) = y$ .
- The image of  $a$  is  $y$ .
- The preimages of  $z$  are  $a$ ,  $c$  and  $d$ .
- The range of  $f$  is  $f(A) = \{y, z\} \subseteq B$ .
- The image of the subset  $S = \{c, d\} \subseteq A$  is  $f(S) = \{z\} \subseteq B$ .

# Definition: One-To-One (Injective) Function

## Definition

A function  $f$  from  $A$  to  $B$  is said to be **one-to-one**, or **injective**, if and only if  $f(a) = f(b)$  implies that  $a = b$  for all  $a$  and  $b$  in the domain  $A$ . A function is said to be an **injection** if it is injective.

By taking the contrapositive of the implication in this definition, a function is injective if and only if  $a \neq b$  implies  $f(a) \neq f(b)$ .

Another way to understand it, a function is injective means that if an element of the codomain has a preimage, then it is a unique preimage.

# Definition: Onto (Surjective) Function

## Definition

A function  $f$  from  $A$  to  $B$  is called **onto**, or **surjective**, if and only if for every element  $b \in B$  there is an element  $a \in A$  with  $f(a) = b$ . A function  $f$  is called a **surjection** if it is surjective.

Another way to understand it, a function is surjective means that each element of the codomain has at least one preimage.

# Definition: One-To-One Correspondence (Bijective) Function

## Definition

The function  $f$  is a **one-to-one correspondence** if it is both one-to-one and onto.

The function  $f$  is said to be **bijective** if it is both injective and surjective. A function is said to be a **bijection** if it is bijective.

# Example 1

Is  $f$  injective?

Is  $f$  surjective?

Is  $f$  bijective?

# Example 2

Is  $f$  injective?

Is  $f$  surjective?

Is  $f$  bijective?

# Example 3

Is  $f$  injective?

Is  $f$  surjective?

Is  $f$  bijective?

# Example 4

Is  $f$  injective?

Is  $f$  surjective?

Is  $f$  bijective?

# Example 5

Is  $f$  injective?

Is  $f$  surjective?

Is  $f$  bijective?

# Venn Diagram of Function Classification

## Definition

Let  $f_1$  and  $f_2$  be functions from  $A$  to  $\mathbb{R}$ . Then  $f_1 + f_2$  and  $f_1 f_2$  are also functions from  $A$  to  $\mathbb{R}$  defined by

$$(f_1 + f_2)(x) = f_1(x) + f_2(x),$$

$$(f_1 f_2)(x) = f_1(x)f_2(x).$$

# Definition: Inverse Function

## Definition

Let  $f$  be a bijection from the set  $A$  to the set  $B$ . The **inverse function** of  $f$  is the function that assigns to an element  $b$  belonging to  $B$  the unique element  $a$  in  $A$  such that  $f(a) = b$ . The inverse function of  $f$  is denoted by  $f^{-1}$ . Hence,  $f^{-1}(b) = a$  when  $f(a) = b$ . The inverse function is also a bijection.

# Definition: Composition of Functions

## Definition

Let  $g$  be a function from the set  $A$  to the set  $B$ , and let  $f$  be a function from the set  $B$  to the set  $C$ . The **composition of the functions  $f$  and  $g$** , denoted by  $f \circ g$ , is defined by

$$(f \circ g)(a) = f(g(a)).$$

# Definition: Factorial

## Definition

The **factorial function**  $f : \mathbb{N} \rightarrow \mathbb{Z}^+$ , denoted by  $f(n) = n!$  is the product of the first  $n$  positive integers, so

$$n! = 1 \times 2 \times 3 \times \cdots \times (n-1) \times n.$$

and  $f(0) = 0! = 1$ .

For example,  $5! = 1 \times 2 \times 3 \times 4 \times 5 = 120$ .

This function increases very fast.

$$10! = 3628800,$$

$$20! = 2432902008176640000,$$

$$30! = 265252859812191058636308480000000,$$

$$40! = 815915283247897734345611269596115894272000000000.$$

For  $n$  sufficiently large,  $n!$  can be approximated by the Stirling's formula:  $n! \approx \sqrt{2\pi n} (n/e)^n$ .

# Definition: Floor Function

## Definition

The **floor function** assigns to the real number  $x$  the largest integer that is less than or equal to  $x$ . The value of the floor function at  $x$  is denoted by  $\lfloor x \rfloor$ . The floor function is often also called the greatest integer function and also denoted by  $[x]$ .

# Definition: Ceiling Function

## Definition

The **ceiling function** assigns to the real number  $x$  the smallest integer that is greater than or equal to  $x$ . The value of the ceiling function at  $x$  is denoted by  $\lceil x \rceil$ .

# Useful Properties of the Floor and Ceiling Functions

Let  $x$  be a real number and  $n$  be an integer.

- $\lfloor x \rfloor = n$  if and only if  $n \leq x < n + 1$ .
- $\lceil x \rceil = n$  if and only if  $n - 1 < x \leq n$ .
- $\lfloor x \rfloor = n$  if and only if  $x - 1 < n \leq x$ .
- $\lceil x \rceil = n$  if and only if  $x \leq n < x + 1$ .
- $x - 1 < \lfloor x \rfloor \leq x < \lceil x \rceil < x + 1$
- $\lfloor -x \rfloor = -\lceil x \rceil$
- $\lceil -x \rceil = -\lfloor x \rfloor$
- $\lfloor x + n \rfloor = \lfloor x \rfloor + n$
- $\lceil x + n \rceil = \lceil x \rceil + n$
